

6 Code and documentation

Code incl. documentation

The code is also included in the assessment of the project. Therefore, make sure that you follow the guidelines for good code (PEP 8, Zen of Python). Comments for easy comprehensibility are particularly important. All lines of code either directly from a LLM or developed with the help of a LLM must be credited accordingly.

Finally, your Git repository must contain a README. The README in combination with the code comments are the documentation of your project. The README has to contain:

- Introduction to the topic of the project, the RQ and data
- Description of the data pipeline
- Short description on how the website was built and deployed. (e.g. How is the data connected?)
- Showcase how to use your web application and the highlights
- Explanation on marking of code via LLM
- A link to your website

The deadline for the repository with the documentation is at 23:59 on the Tuesday after the final presentations. We will grade the latest version before this timestamp.
